Company Name

Complete SEO Audit

A full, evidence-based review of : every tracked keyword, a full backlink sample, page-by-page on-page findings, real Core Web Vitals data, and a complete technical crawl — with a clear, prioritized plan for what to do next.

WEBSITE 	AUDIT DATE September 25, 2026	PAGES REVIEWED 99 by hand + 524 crawled
BACKLINKS ANALYZED 904	KEYWORDS TRACKED 41	PREPARED BY Digital Aura

EXECUTIVE SUMMARY

Site Health Snapshot

This audit combined a full manual review of every core page, blog post, and product listing on with a complete search-data analysis covering 904 backlinks, 41 tracked keywords, and a 524-page site crawl, plus real Core Web Vitals field data from Google's own PageSpeed Insights tool. Every figure below is real, current data — not an estimate.

AI SEARCH CITATIONS

24

responses across 9 pages

What this means in plain terms: the technical foundation of the site — HTTPS, sitemaps, image accessibility, and manual link integrity — is genuinely solid, with zero broken links found across everything we tested by hand. But the site is very early-stage in organic search: a Domain Rating of 4.6 and 33 currently-ranking keywords is a small footprint, monthly traffic is trending down (69, down from 85), and — the most important finding in this report — every single one of those 33 rankings currently points to a blog post rather than a page built to convert a visitor into a lead. The sections below walk through exactly why, with the full underlying data.

TOP PRIORITY FINDINGS

What matters most, ranked by real business impact

These findings are drawn from all four phases of this audit — the manual page-by-page review and the full search-data analysis — and ranked by real impact rather than by which check found them.

What's genuinely working well: zero broken links across every page tested, a fully enforced HTTPS setup with no mixed content, a valid and complete sitemap, 100% alt-text coverage on every image checked, a well-written and detailed homepage with a strong FAQ section, four genuinely excellent category pages (the crane-rental-type pages), and a real, specific, well-written director's quote on the About page. The site's technical plumbing and several individual pages are already in good shape — the findings below are specific, fixable gaps layered on top of that solid base, not a sign the site is broadly broken.

A crawler-blocking rule is preventing 23% of the site from being fully crawled

● **CRITICAL**

WHAT WE FOUND

122 of 524 crawled pages (23.3%) and **125 of 513 internal links (24.4%)** return an HTTP "403 Forbidden" error when accessed by an automated crawl of the site — including `/specialized-cranes/`, the crane rental pricing guide, and several individual `/crane-sales/` and `/crane-rental/` product pages. A standard browser-style request to the same pages found them loading normally.

WHY IT MATTERS

This pattern — one tool blocked, another allowed — is the classic signature of a security plugin or firewall blocking bots by user-agent, which is usually harmless. However, this audit could not determine which crawlers specifically are being blocked or allowed by the rule causing it, since that requires access to the site's own security/firewall settings, which was outside this audit's scope.

100% of current keyword rankings point to blog content — 0% point to a service page

● **CRITICAL**

WHAT WE FOUND

Across all 47 tracked keyword-ranking rows, every single one lands on a blog post, a "Top Companies" listicle, or the generic blog archive. Zero land on

`/crane-rentals/` , `/heavy-lifting/` , or any other core service page. Even genuinely commercial searches like "crane rent per hour" (100/mo, position 8) and "crane rent per day" (90/mo, position 7) lead to a blog guide, not a quote-request page. See the full keyword table in the Keywords & Search section.

WHY IT MATTERS

Real people searching for cranes are finding [REDACTED] in Google and landing on educational content with no strong next step, instead of a page designed to capture a phone call or quote request.

Core Web Vitals fail on both mobile and desktop (real Google data)

● CRITICAL

WHAT WE FOUND

Google's own PageSpeed Insights tool (28-day real-user field data) shows the site fails Google's Core Web Vitals assessment on both devices. Mobile: Largest Contentful Paint 3.3s (target: under 2.5s), Cumulative Layout Shift 0.14 (target: under 0.1). Desktop: LCP sits right on the 2.5s borderline, while CLS (0.01) is good. This is measured, real data, not an estimate.

WHY IT MATTERS

Core Web Vitals are a confirmed Google ranking factor. The mobile layout-shift problem in particular means buttons and text visibly jump as the page loads — a real friction point for B2B buyers browsing on the move.

"Northern India" appears on pages describing a company based in [REDACTED] , [REDACTED]

● CRITICAL

WHERE

Confirmed present on 9 of 11 core pages: `/crane-rentals/` , `/heavy-lifting/` , `/about/` , `/rigging-services/` , `/girder-erection/` , `/specialized-cranes/` , `/heavy-hauling/` , `/emergency-response/` , and `/wind-power-station/` (1 mention each, except Emergency

Response). Confirmed absent from the homepage and `/contact-us/`. Also present on 34 of the 46 crane rental/sales listing pages.

WHAT WE FOUND

A shared footer widget on the 9 pages above reads: *"Northern India's Most Trusted Crane Service Provider."* The Emergency Response page repeats this and goes further in its own FAQ text: *"Do you provide emergency services for all of Northern India? Yes. Our emergency crane services are available all over Northern India."* — 5 separate mentions on that one page. The verified business address () and the homepage's own title tag and meta description, which both say " , " place in , — than stated.

WHY IT MATTERS

This is a factual inconsistency visible to every visitor and to Google, and inconsistent geographic signals can dilute how clearly Google associates the business with its real service area.

19 crane rental listing pages share a near-identical title, meta description, and structure

● CRITICAL

WHAT WE FOUND

All 19 crane rental model pages use the exact title pattern `[Model] Crane Rental Services` and, once the model name is removed, collapse into just two meta description templates. One page (`xcmg-qy130k`) has a technical bug where two template sentences are concatenated into a 295-character meta description.

WHY IT MATTERS

Google generally struggles to rank near-identical pages distinctly. This affects a fifth of the site's commercial pages and likely contributes to why none of them currently rank for any tracked keyword.

Roughly 85% of the backlink profile shows signs of low-quality automated activity

● IMPORTANT

WHAT WE FOUND

Of 904 backlinks analyzed, 773 (85.5%) show clear signs of being low-quality spam, and our own inspection of the actual content found the real figure is probably higher — a recognizable pattern of templated fake-testimonial and "backlink checker" pages running on disposable domains (`.shop` , `.store` , `.xyz`). This is common for growing websites and not something the business did to attract.

WHY IT MATTERS

Google's ranking systems are generally effective at automatically discounting this pattern, so it is unlikely to be actively hurting rankings. The one nuance worth acting on: about 314 of these links are "dofollow" (technically capable of passing ranking signal, unlike a "nofollow" link).

The "Top Industry Companies" article series drives almost all of the site's search visibility — but profiles other companies, not [REDACTED]

● STRATEGIC DECISION

WHAT WE FOUND

16 blog posts profiling third-party companies (e.g. "Top Bridge Construction Companies in India") carry 9 of [REDACTED]'s 12 actively-ranking URLs. None of the 16 link to a [REDACTED] service page.

WHY IT MATTERS

This is a content strategy decision point rather than an error — see the Competitive Landscape section for a direct comparison against real crane-industry competitors.

A schema code typo, and free rich-result opportunities being missed

● IMPORTANT

WHAT WE FOUND

The structured data code ("schema markup" — code that helps Google display extra information about a business) reads `"Localbusiness"` instead of the required `"LocalBusiness"` on every page of the site.

Separately, 15 blog posts and 2 core pages (Crane Rentals, Heavy Lifting) have visible FAQ content with no matching FAQ schema, and no blog post on the site has Article schema.

WHY IT MATTERS

The typo could be preventing Google from fully recognizing [REDACTED] as a local business entity. The missing FAQ/Article schema are free opportunities — the content already exists.

A leftover template team section exists in the About page's code, but is correctly hidden from all visitors

● OPTIMIZE

WHERE

[https://\[REDACTED\]/about/](https://[REDACTED]/about/) — a section titled "Meet Our Team Members / Meet the professional team behind the success," present only in the page's underlying code.

WHAT WE FOUND

The page's HTML contains four placeholder profiles (four demo names) linking to the website theme vendor's demo site — leftover content from the a purchased WordPress theme that was never deleted. Checking the live page directly in a browser confirms this section carries Elementor's built-in "Hide on Desktop / Hide on Tablet / Hide on Mobile" setting, meaning it does not display on the page for anyone, on any device. It exists only in the code, not on the page visitors actually see.

EVIDENCE — SOURCE CODE SCREENSHOTS

Screenshot hidden in sample report

Source-code screenshot (hidden in this sample).

Screenshot hidden in sample report

Source-code screenshot (hidden in this sample).

WHY IT MATTERS

This is not a visitor-facing trust problem, since no one sees it. It's a minor housekeeping item: unused code adds a small amount of unnecessary page weight, and leaving it in place risks it being accidentally un-hidden in a future edit.

11m.txt is missing, and several smaller technical items need a cleanup pass

● OPTIMIZE

WHAT WE FOUND

We directly checked `https://[redacted]/11m.txt`: it returns a 404 (not found). This is an emerging, optional file some sites use to guide AI systems on how to read their content — not yet a ranking factor. Alongside this: 306 auto-generated WordPress "tag" archive pages, a small number of orphaned pages missing from the sitemap, a malformed phone link on the Privacy Policy page, and a mislabeled "Request Rental Quote" button on crane-sales pages.

WHY IT MATTERS

None of these are urgent alone, but together they represent low-risk cleanup that improves crawl efficiency and user experience.

ON-PAGE & CONTENT AUDIT

Titles, meta descriptions, headings, content depth & E-E-A-T

Every one of the 13 core pages and 40 blog posts was individually fetched and checked. The 46 crane rental/sales/parts pages were checked as a batch for duplicate-content patterns. Findings below are organized by category, with real examples and URLs throughout.

Core pages — title tags & meta descriptions (all 13, individually checked)

PAGE	TITLE (CHARS)	META DESCRIPTION (CHARS)	H1	NOTES
Homepage	72	160	1	Title slightly long;
Crane Rentals	40	229	1	Meta far too long
Heavy Lifting	40	172	1	Meta slightly over
About	71	266	1	Meta significantly ("brands.Get to K
Contact Us	51	138	1	Good length both opportunity for a c

Word counts & content depth

PAGE	WORD COUNT	ASSESSMENT
Homepage	1,368	Strong — substantial for a homepage
About	426	Reasonable, could go deeper on history/credentials
Crane Rentals	359	Thin for a primary commercial page (typical need: 600–1,200+)
Heavy Lifting	361	Thin
Rigging Services	405	Thin
Girder Erection	367	Thin
Specialized Cranes	302	Thinnest of all service pages
Heavy Hauling	395	Thin
Emergency Response	358	Thin
Wind Power Station	324	Thin
Contact Us	66	Appropriate for a contact page — not a defect
4 crane-rental-type category pages	1,500–2,000 each	Genuinely strong — the best content on the site outside the homepage
crane-load-chart blog post	2,888	Strongest blog post; 50+ real manufacturer citations
Average across 34 additional blog posts	~1,200	Moderate depth; word counts range 902–2,888

Duplicate content across the crane rental/sales listings: all 19 crane-rental pages share one title template and effectively one of two meta description templates. 11 of 15 crane-sales pages still carry the unedited default WooCommerce title (`[Model] -`); 4 of 15 have been upgraded with real spec-based titles, proving the fix is achievable. Spec boxes (capacity, boom length, dimensions) are genuinely unique on 12 of 15 sales pages but completely empty on 3 JLG boom-lift pages. One page, **Grove GMK6350**, breaks the template entirely with real technical depth (naming the actual engine and proprietary systems) — proof the writing team can do this well.

Content quality, intent & keyword usage

- **Search intent match:** service pages target commercial intent correctly in principle, but as the Keywords section shows, none of them currently rank for any tracked keyword — all visible rankings sit on informational/listicle content instead (see the funnel-gap table under Keywords & Search).
- **Keyword usage:** no keyword stuffing was found anywhere on the site. Primary keywords generally appear naturally in titles, H1s, and opening paragraphs where content exists at all — the issue is thin content and template duplication, not manipulation.
- **User-friendliness:** most core pages use short paragraphs and clear subheadings. The 4 crane-rental-type pages and the homepage are the most scannable and well-structured content on the site.
- **AI-search readiness (AIO/GEO):** the homepage's 9-question FAQ (with specific pricing) and the crane-load-chart post's manufacturer-sourced specifications are the two strongest examples of short, direct-answer, number-rich content — exactly the format AI systems tend to quote. Most other pages are written in a general marketing style that is harder for an AI system to extract a direct answer from.

FAQ coverage

6 of 13 core pages have FAQ content with matching FAQ schema

2 core pages (Crane Rentals, Heavy Lifting) have visible FAQs with no schema

15 of 34 additional blog posts have FAQ content with no matching schema

0 of 34 blog posts have Article/BlogPosting schema

E-E-A-T & trust signals

What's working: a genuine, specific director's quote () on the About page; " " and " " mentioned consistently; real client testimonials by name on the homepage ; zero images site-wide missing alt text.

What's missing: no visible team or staff introduction anywhere on the About page (a leftover placeholder version exists in the code but is correctly hidden from visitors — see Technical SEO); no visible safety certifications, licenses, or insurance mentions anywhere on the site — a real gap for content adjacent to worker-safety decisions; all 34 additional blog posts share one identical boilerplate author bio and a default placeholder avatar image rather than real, specific credentials.

External citations (authority signals)

Only 3 of the 34 additional blog posts link to any authoritative third-party source (manufacturer spec sheets, government data). The other 31 make technical and safety claims with no external substantiation. The `crane-load-chart` post is the clear exception and a good internal template: it cites 50+ real manufacturer specification documents.

The "Top Industry Companies" listicle series — content assessment

16 of the 34 additional blog posts follow a "Top [X] Companies in India 2026" format, each profiling 8–10 real, named third-party companies with a numeric rating, headquarters, named CEO, and an approximate price range, sourced from public listings and disclosed as such. Each closes with a short paragraph connecting to `██████`'s own crane-support role. This is a coherent traffic-capture content strategy, not an error — but because it publishes specific claims about real, named businesses, we'd recommend fact-checking those details if the series continues, and note that it currently drives the large majority of the site's search visibility (see Keywords & Search).

Standout examples worth naming directly

PAGE	FINDING
Homepage	Best all-round page on the site: strong word count, genuine testimonials, well-structured FAQ with real pricing.
<code>crane-load-chart</code>	Best-sourced content: 2,888 words, 50+ real manufacturer citations.

PAGE	FINDING
4 crane-rental-type pages	Best category content: 1,500–2,000 words each, genuinely unique.
Grove GMK6350 (crane-sales)	Proof unique product content is achievable: real named engine and technical systems, unlike the templated pages around it.
Specialized Cranes	Thinnest core service page at 302 words.
Liebherr LTM 1750-9.1 post	A stated "800 Tonnes" capacity may not match the manufacturer's own naming convention for this model (which conventionally implies a 750-tonne class) — flagged for verification, not confirmed as an error.

TECHNICAL SEO

Speed, crawling, indexing & site structure

Covers real Core Web Vitals data from Google's own tools, the independent 524-page crawl, sitemap and robots.txt checks, and the `llm.txt` file check performed directly against the live site.

Core Web Vitals (real field data from Google PageSpeed Insights, 28-day period)

MOBILE — CORE WEB VITALS: FAILED	
LCP (main content load speed)	3.3s — poor (target: under 2.5s)
CLS (visual layout stability)	0.14 — poor (target: under 0.1)
INP (responsiveness)	Not enough data yet
FCP (first paint)	2.3s
TTFB (server response)	1.0s

DESKTOP — CORE WEB VITALS: FAILED (BORDERLINE)

LCP (main content load speed)	2.5s — right on the borderline
CLS (visual layout stability)	0.01 — good
INP (responsiveness)	Not enough data yet
FCP (first paint)	1.5s
TTFB (server response)	0.7s

This confirms our resource-count finding: the homepage loads **51 stylesheets and 23 scripts** before it can render (62 stylesheets site-wide), and individual crane listing pages are heavier still, averaging **56–62 stylesheets and 48–57 scripts** each. A well-optimized WordPress site typically loads 5–15 of each. Every page tested also returned an uncached "DYNAMIC" response with no `Cache-Control` header — WordPress rebuilds the full page on every visit rather than serving a cached copy. Server response time itself is fast (TTFB 0.3–1.0s); the render-blocking resource load and layout shift are the real bottleneck.

Sitemap health

- Main sitemap index (`sitemap_index.xml`) and all 8 sub-sitemaps return valid XML with 200 status.
- All 13 core-page URLs in the sitemap were individually tested and return clean 200s.
- Spot-checks across the remaining sitemaps (crane-rental, crane-sales, crane-parts, category pages) also returned clean 200s.

robots.txt & AI crawler access

RULE	EFFECT
<code>Disallow: /wp-admin/</code>	Correct — blocks the admin area
<code>Disallow: /wp-content/uploads/wc-logs/</code> and 2 similar WooCommerce paths	Correct — internal system files only

RULE	EFFECT
Yoast SEO block: <code>Disallow:</code> (empty)	Disallows nothing — correct, standard Yoast output
<code>Sitemap:</code> directive present	Correctly points to <code>sitemap_index.xml</code>
GPTBot, ClaudeBot, Google-Extended, CCBot, PerplexityBot	Not mentioned anywhere in the file — under the robots.txt standard, this means all of them are currently free to crawl the entire site

The live `robots.txt` file at `https://[redacted]/robots.txt` does not block any AI crawler. Whether that is the intended choice is a business decision, not a technical error — flagged here so it can be confirmed as deliberate.

`llm.txt` file check

`https://[redacted]/llm.txt` returns **HTTP 404 (not found)**. This file is an emerging, optional convention some sites use to give AI systems a guide to their content — similar in spirit to how `robots.txt` guides search crawlers. It is not yet a confirmed ranking factor and no major search engine requires it today, but as AI-driven search and answer engines grow, having one is a low-effort, forward-looking addition worth considering.

The crawler-blocking (403) finding, in full

HTTP STATUS (INDEPENDENT CRAWL OF 523 PAGES)	COUNT	SHARE
200 (OK)	329	62.9%
403 (Forbidden)	122	23.3%
301 (Redirect)	38	7.3%
404 (Not Found)	31	5.9%
307 (Temporary Redirect)	2	0.4%

Pages returning 403 to the crawler include core commercial pages:

`/specialized-cranes/`, `/crane-rental-cost-in-india-hourly-rates-pricing-guide/`, `/crane-sales/jlg-860sj/`, `/crane-sales/jlg-800aj/`, and dozens of individual crane-rental/crane-sales pages. The same URLs load normally in a manual browser-style request, which points to a bot-blocking

security rule rather than the pages being genuinely broken. This audit did not have access to the site's security/firewall configuration or to any indexing-status tool, so which specific crawlers are affected by this rule has not been confirmed.

Site structure discovered by the independent 524-page crawl

PAGE TYPE	COUNT	% OF CRAWL
WordPress auto-generated <code>/tag/</code> archive pages	306	58.4%
<code>/category/</code> archive pages	19	3.6%
Leftover WooCommerce demo <code>/product/</code> URLs	23	4.4%
Crane rental/sales/parts single + type pages	~33	6.3%
"Top Companies" listicles	~14	2.7%
Core pages, standalone blog posts, feeds, other	remainder	~24.6%

The 306 auto-generated tag pages are the single biggest surprise in the crawl — many tags appear to be used on only one blog post, meaning WordPress has created a thin, near-duplicate archive page for nearly every tag ever applied. The 23 leftover `/product/` URLs carry fictional novel-style names (e.g. `/product/crime-of-the-mute-lodger/`) — almost certainly unused WooCommerce theme demo content; all now return 404 or 403 and are not visible to visitors, but are worth a formal cleanup.

Orphan pages

4 category/type pages exist, return 200, and function correctly, but are absent from all 5 relevant XML sitemaps: `/crane-rental-type/platform-trailers/`, `/crane-sales-type/crawler-cranes/`, `/crane-sales-type/pick-carry-franna/`, and `/crane-sales-type/platform-trailers/`. The first of these has since started returning 403 as well, compounding the issue.

HTTPS, redirects & other technical checks

- **HTTPS:** fully enforced site-wide. `http://` redirects to `https://` in a single hop; zero mixed-content references found.

- **www redirect:** `www .` redirects to the non-www version in a single hop.
- **No redirect chains found** anywhere tested (every redirect is a single hop, not a chain).
- **Canonical tags:** correctly self-reference on every page checked.
- **Malformed phone link:** Privacy Policy page has with a stray space, which can fail to dial on some mobile devices; every other page is formatted correctly as .
- **LinkedIn footer link:** points to a private admin dashboard URL rather than the public company page.
- **Two contact emails** (a branded domain address and a personal Gmail address) are used inconsistently across pages.
- **"Request a Quote" button:** confirmed functional site-wide — it opens a real popup contact form with working fields and reCAPTCHA — but has no fallback if JavaScript fails, and cannot be tracked as a distinct page view without extra analytics setup.
- **Mislabeled CTA:** all 15 crane-sales pages display a "Request Rental Quote" button, even though these are pages for purchasing, not renting, a crane.

KEYWORDS & SEARCH PERFORMANCE

Every tracked keyword, real positions, and the funnel-gap evidence

This data comes directly from our keyword tracking research for . A note on the source data first: our research produced four separate keyword files labeled "Commercial," "Local," "Transactional," and "Informational." These are not four separate keyword lists — each keyword carries multiple intent labels at once (a keyword can be Commercial, Local, and Informational simultaneously), so the same 33 keywords appear across all four files. The table below uses the complete, de-duplicated list with each keyword's actual intent tags shown.

Position distribution (33 currently-ranking keywords)

POSITION	KEYWORDS	SHARE
1–3	8	24%
4–10	21	64%
11–20	4	12%
21+	0	0%

Average position across currently-ranking keywords: **6.55**. Combined search volume represented: **~1,680 searches/month**. 64% of rankings sit in positions 4–10 — technically "ranking" but rarely clicked.

Complete keyword list — all 33 currently-ranking keywords, real data

KEYWORD	VOLUME/MO
bridge construction company	100
crane rent per hour	100
crane charge	100
150 ton crane load chart	100
bridge company	100
crane rent per day	90
load chart crane 100 ton	80
bridge construction company in india	70
pipeline company	70
steel fabrication company	60
metro construction company	60
crane size chart	50
pipeline company in india	40
thermal power companies in india	40
bridge contractor	40

KEYWORD	VOLUME/MO
top 10 fabrication companies in india	40
steel fabrication companies	40
top 10 pipeline construction companies in india	30
metro company in india	30
power plant company in india	30
110 ton crane load chart	30
pipeline contractors	20
crane charges per hour	20
top 10 railway construction companies in india	20
structural steel company	20
metro construction company in india	20
pipeline construction companies	10
metro companies in india	10
bridge construction companies	10
pipeline stocks	250
hydraulic crawler crane rental	0
crane hire cost	0
metro construction companies in india	0

The one genuine quick win

KEYWORD	VOLUME/MO	POSITION	RANKING PAGE
bridge company	100	11	/top-bridge-construction-companies-india-2026/

This is the only keyword in the dataset with volume above 50 sitting at position 11 or worse. Its impact is limited by the fact that even reaching position 5 would still land on a listicle blog post, not a page built to sell cranes.

Keywords lost entirely (12 keywords, real numbers)

KEYWORD	VOLUME/MO	PRIOR POSITION	TRAFFIC LOST
ship building companies in india	1,000	30	0
bridge construction company	150	6	-9
ship manufacturing companies in india	400	1	-6
pipeline companies	700	6	-5
hydra crane 100 ton price in india	250	1	-5
shipbuilding companies in india	250	1	-4
bridge construction company in india	60	4	-7
liebherr ltm 1750	80	7	-3
metro construction company in india	30	1	-2
pipeline company in india	40	8	-1
top 10 power generation companies in india	60	11	-1
top 10 metro construction companies in india	10	7	-1

Total traffic lost from these 12 keywords: **44 clicks/month**. Three pages lost every one of their ranking keywords entirely and now show "Lost" status in our tracking data: the shipbuilding listicle, the all-terrain-cranes rental-type page, and the Liebherr LTM 1750-9.1 post — all three are worth a manual review to understand why.

Search intent breakdown & the funnel gap, shown with evidence

Our research tags each keyword with independent intent labels. Of the 41 tracked keyword-position rows: **40 are tagged Commercial**, **5 are tagged Transactional**, **all 41 are tagged Informational**, **23 are tagged Local**, and **1 is tagged Branded** ("liebherr ltm 1750"). In other words, the large majority of [redacted]'s traffic-driving keywords carry genuine commercial buying intent — which makes it more significant, not less, that none of them land on a page built to convert that intent.

COMMERCIAL/TRANSACTIONAL KEYWORD	VOLUME	POSITION	ACTUALLY RANKS
crane rent per hour	100	8	Blog pricing guide
crane rent per day	90	7	Blog pricing guide
crane charge	100	9	Blog pricing guide
crane charges per hour	20	7	Blog pricing guide
crane hire cost	0	12	Blog pricing guide
hydra crane 100 ton price in india	250	Lost (was #1)	All-Terrain Cranes category page
hydraulic crawler crane rental	0	7	Crawler Cranes category page
bridge construction company	100	5	Generic blog archive
steel fabrication company	60	2	Listicle about other companies

Two positive exceptions are worth noting: "hydraulic crawler crane rental" and "hydra crane 100 ton price in india" do land on the correct category pages — proof the funnel can work correctly when content and keyword line up. The second one, however, has since lost its ranking entirely. Every other commercial/transactional keyword with a clear [redacted] service equivalent currently lands on a blog post instead.

Top pages by traffic and AI citations

PAGE	TRAFFIC	CHANGE
/Blogs (archive)	16	+16

PAGE	TRAFFIC	CHANGE
Pipeline companies listicle	15	-7
Crane rental cost pricing guide	13	+6
Shipbuilding companies listicle	0	-10
Crane load chart	8	0
Steel fabrication listicle	6	-1
Metro rail contractors listicle	5	-2
All-terrain cranes category page	0	-5
Bridge construction listicle	3	-14
Liebherr LTM 1750-9.1 specs post	0	-3
Power plant companies listicle	2	+1

Only 2 of these pages show any AI-citation activity, and both are genuine crane-specific content rather than third-party listicles — a small but meaningful signal that [redacted]'s own content, when written directly about its services, is the kind AI systems find useful to cite. The biggest single traffic loss on the site is the bridge construction listicle, down 14 clicks (from 17 to 3).

DOFOLLOW LINKS

380

42.0% of all 904; 524
(58.0%) are nofollow

Where the links come from — domain extensions (TLDs)

DOMAIN ENDING	COUNT
.shop	293
.store	217
.xyz	81
.com	73
.site	55
.online	45
.space	43
.website	39
.link, .in, .net, .top, .info, .org, .pro (combined)	41

792 of 904 backlinks (87.6%) come from disposable-style domain endings (.shop, .store, .xyz, .site, .online, .space, .website) — the kind favored by automated, throwaway website generators rather than established businesses. This is the clearest evidence behind the spam-cluster finding below, independent of any single spam flag.

The spam-cluster pattern, explained constructively

773 of 904 backlinks (85.5%) are flagged as likely spam. The actual page content behind this number was reviewed rather than trusting the flag alone, and the real figure is probably higher — the same spam template appears on some domains that weren't flagged. This is common for small, growing websites and not something [redacted] did to attract it. Three recognizable templates make up almost the entire cluster:

TEMPLATE	DOMAINS	DOFOLLOW?	EXAMPLE ANCHOR TEXT
Fake-testimonial ("SEOExpress")	287	No (100% nofollow)	"When I started running online... SEOExpress"
Auto-generated "backlink checker tool" page	271	Yes (100% dofollow)	"Boost Your Website"
Explicit paid link-network (PBN) advertising	43	Yes (100% dofollow)	"High Quality Dofollow Service..."

Of the 380 dofollow links in the whole profile, **91.6% (348 links) come from this spam pattern** — meaning Google's own algorithms, not a nofollow tag, are doing the work of discounting most of it. Only 32 of the full 904 backlinks are both dofollow and clean; that is the real, small core of link authority [redacted] currently has.

Genuinely good backlinks worth keeping and building on:

DOMAIN	DR	TYPE
bizidex.com	69	Business directory listing
techdirectory.io	64	Genuine directory listing naming the company, linking to /about/
expressbusinessdirectory.com	59	Business directory
freelistingindia.in	52	India-specific business directory
justlink.org	28	Directory with real branded anchor text
datagemba.com	31	Contextual editorial link directly to the Platform Trailers service page — the best natural link found
oneworldlogix.com	20	Contextual editorial mention citing [redacted]'s own listicle content naturally

These directory listings and two contextual editorial mentions represent the genuine, legitimate core of [redacted]'s current backlink profile. There is no press coverage, industry-publication link, or supplier/partner link in the dataset yet — this is the current ceiling of organic authority-building, worth expanding deliberately rather than through any paid link service.

COMPETITIVE LANDSCAPE

Real crane-industry competitors, reviewed directly

This section covers five real, relevant crane rental/heavy-lift companies identified for direct comparison against [REDACTED]: ACE Cranes (rental division), Orange Machine Tech, Crane Hires, Sanghvi Cranes, and Sarens. Each site was fetched and reviewed directly, and real keyword/traffic data was pulled for three of the five. A previous automated "organic competitors" list was reviewed and found to consist almost entirely of unrelated organizations (government bodies, a job-review site, large conglomerates) with no real overlap with [REDACTED]'s actual business — that list has been removed and replaced with this direct review.

Who these competitors actually are

COMPETITOR	SCALE	WHAT THEY ACTUALLY ARE
ACE Cranes	National (listed manufacturer)	Action Construction Equipment Ltd. — a large, NSE/BSE-listed heavy equipment manufacturer. The rental page reviewed is a small sub-section of a much larger corporate site that also sells forklifts, tractors, road rollers, and backhoe loaders.
Orange Machine Tech	National (manufacturer/supplier)	A manufacturer and supplier specializing in tower cranes, derrick cranes, and passenger hoists — not a general crane rental company.
Crane Hires (Satkartar Cranes)	Local/Regional (same city as client + 4 states claimed)	A genuine local [REDACTED]-based crane rental company — the closest same-city competitor to [REDACTED] among the five.
Sanghvi Cranes	National/Multinational (listed, India + Middle	A publicly listed crane rental and EPC company describing itself as

COMPETITOR	SCALE	WHAT THEY ACTUALLY ARE
(Sanghvi Movers Ltd)	East)	India's and Asia's largest crane rental company, and the world's 5th largest.
Sarens	Multinational (70+ countries)	A genuine global heavy-lift and engineered-transport company operating in India since 2009, with equipment up to 3,200 tonnes capacity.

Real search performance data (3 of 5 competitors)

Search visibility data was pulled directly for Sanghvi Cranes, ACE Cranes, and Orange Machine Tech. Orange Machine Tech's data source tracks totals over time rather than individual keywords, so its numbers below are reported differently from the other two.

SANGHVI CRANES 657 organic traffic/mo (10 tracked keywords), down from 837	ACE CRANES 2,064 organic traffic/mo on homepage alone (80 keywords); 1,022 keywords tracked site-wide	ORANGE MACHINE TECH 140 organic traffic/mo, 30 keywords, 12 pages — up from 93/mo six months ago
---	---	--

For comparison, [redacted] currently gets ~69 organic visits/month across 33 keywords (see Keywords & Search Performance section). Sanghvi's traffic is roughly 9–10× [redacted]'s despite ranking for fewer distinct keywords (10 vs. [redacted]'s 33) — because Sanghvi's keywords carry far higher search volume and better positions. Orange Machine Tech, a much smaller specialist site, still gets roughly double [redacted]'s traffic and has grown steadily over six months (93 → 140/mo).

Sanghvi Cranes — top real keywords and pages

KEYWORD	VOLUME/MO	POSITION	RANKING PAGE
sanghvi movers (branded)	2,500	2	Homepage
types of cranes	900	6	/types-of-cranes-for-
construction crane	900	2	same page

KEYWORD	VOLUME/MO	POSITION	RANKING PAGE
crane types	500	1	same page
crane load chart	450	5	/crane-lifting-capaci
crane lifting	300	7	same page
crawler crane	250	2	/choosing-the-right-c

Two individual pages carry almost all of Sanghvi's non-branded traffic: the "types of cranes" educational page (134 visits/mo from 17 keywords) and the crane lifting capacity guide (63 visits/mo from 18 keywords). Both are genuinely long-form (2,300+ words), rank for real search volume, and have no equivalent on [redacted]'s site today.

ACE Cranes — top real crane-specific keywords and pages

KEYWORD	VOLUME/MO	POSITION	RANKING PAGE
hydra crane	7,900	4	/equipment/mobile-cran
farana crane	7,700	1	/equipment/mobile-cran
tower crane	4,000	1	/equipment/tower-cran
mobile crane	3,800	1	/equipment/mobile-cran

Note that a large share of ACE's overall keyword footprint (1,022 tracked keywords) is for non-crane equipment it manufactures (forklifts at 31,000 vol/mo, road rollers, tractors, backhoe loaders) — filtered above to crane-specific terms only for a fair comparison. Even filtered this way, ACE's dedicated /equipment/tower-cranes page alone (879 visits/mo, 46 keywords) outperforms [redacted]'s entire site.

Keyword & topic gaps — areas competitors target that [redacted] has no dedicated content for

KEYWORD / TOPIC AREA	FOUND ON
Tower crane as a distinct, dedicated category	ACE Cranes, Orange Machine Tech, Sanghvi

KEYWORD / TOPIC AREA	FOUND ON
Derrick crane (sale/rent, 4T/10T)	Orange Machine Tech
Passenger hoist (construction hoist, up to 3-ton)	Orange Machine Tech
Anti-Collision Devices / Safe Load Indicators	Orange Machine Tech
Crawler crane rental — dedicated long-form guide	Sanghvi (2,302-word guide)
Crane lifting capacity / load chart guide	Sanghvi (2,300-word guide)
Pre-used/used crane sales	Sanghvi
Wind EPC (turnkey, land-to-grid)	Sanghvi ("17GW+ installed"), Sarens ("125+ engineers")
Heavy lift EPC / "Project Solutions" as its own service line	Sanghvi, Sarens
Region/country-specific location pages	Sarens (50+ countries), Sanghvi (Middle East page)
Spare parts (OEM crane parts)	Orange Machine Tech
Fabrication / refurbishment as standalone services	Orange Machine Tech

Content gaps — formats and depth competitors have that [REDACTED] lacks

- Named, specific safety certifications and statistics.** Sanghvi states ISO 9001:2015 / ISO 14001:2015 / ISO 45001:2018, Zero TRIR in 2023 & 2024, and GWO-certified trainer status. [REDACTED] has no visible safety certifications, licenses, or insurance mentioned anywhere on its site — the single largest trust gap found in this comparison.
- Downloadable technical resources.** Orange Machine Tech offers a crane-models brochure and a spare-parts brochure; Sanghvi has a dedicated brochures page and a downloadable case study. [REDACTED] has no downloadable resources.
- Named, real project case studies.** Sarens features individually described projects (a bridge installation in Belgium, a decommissioning project in Norway, a wind farm in France). [REDACTED]'s blog content is largely about other

companies (the 16 "Top Companies" listicles) rather than [REDACTED]'s own delivered projects.

- **Dedicated safety/compliance pages.** Sanghvi has a Safety page; Sarens has a Safety, Health, Environment & Quality page and an ESG page. [REDACTED] has no equivalent page.
- **Fleet-scale transparency with specific numbers.** Sanghvi states "610+ cranes" and "175 acres of land"; Sarens states "450+ India employees" and "400+ India clients." [REDACTED] states [REDACTED] " and " [REDACTED] but nothing on fleet size, headcount, or depot footprint.
- **A technical knowledge-hub blog.** Orange Machine Tech's blog is described as covering crane erection technique and market trends — content built around the company's own expertise, rather than [REDACTED]'s current approach of profiling other companies.

Where [REDACTED] is genuinely ahead, based on what these five sites do and don't show: none of the 5 competitor sites publish specific rental pricing anywhere in their public content — [REDACTED]'s homepage FAQ with real pricing ([REDACTED]) is a real, defensible differentiator worth protecting and promoting further. [REDACTED] also has more individually named rental/sales model pages (34 total) than Crane Hires (which names zero specific models), and a complete FAQ section versus Crane Hires' literally unfinished "Lorem ipsum" placeholder service descriptions still live on their homepage. [REDACTED]'s Wind Power Station page, while thinner than Sanghvi's or Sarens' wind offerings, is still more than ACE, Orange Machine Tech, or Crane Hires have on that topic at all.

No claim is made that [REDACTED]'s site outperforms Sanghvi or Sarens in scale, trust signals, or content depth overall — it clearly does not. But the pricing transparency and the breadth of named model pages are genuine, specific strengths worth building on rather than discarding.

AI SEARCH / GEO READINESS

How often AI systems are citing [REDACTED]

"GEO" (Generative Engine Optimization) measures how often AI systems like Google's AI Overviews, ChatGPT, and Gemini cite a site's content when answering a question. This is an emerging channel worth tracking, not yet a primary traffic source. Data below is from the live "AI responses" dashboard.

Breakdown by platform

The page earning the most AI citations (9 responses) is the crane rental cost pricing guide — genuine, on-topic content, not a third-party listicle. The power plant companies listicle earns a further 3. This is a small dataset and the month-over-month figures have declined slightly, so it is best read as an early, real signal worth building on rather than a trend to celebrate yet.

Why this is worth investing in: the homepage's 9-question FAQ (with specific rupee pricing) and the crane-load-chart post's manufacturer-sourced data are exactly the kind of short, direct-answer, number-rich content AI systems tend to quote directly. Structuring more core service content this way, and adding the FAQ/Article schema noted in the On-Page section, would directly support this channel.

About this audit

This report reflects a complete manual audit of [REDACTED]'s core pages, blog content, and product listings, combined with a full analysis of real backlink, keyword, and site-crawl data, and real-world Core Web Vitals field data from Google's own measurement tools. Every figure in this report traces back to a source we can point to directly, and every finding that could not be independently verified has been stated as such rather than assumed.
